

SOUND ABSORBENT

- Wall-mounted with a unique, durable micro-perforated surface that enables a high level of hygiene
- Solid birch frame with bevelled edges to reduce the risk of ligature attachment
- Available with custom prints, photographs, or other patterns on the front surface

Reducing noise levels in healthcare environments has a stress-reducing effect, which in turn can improve sleep quality, reduce aggression, and support recovery. A sound absorber can be added when particularly high demands are placed on the acoustic environment and the sound-absorbing properties of the room's textiles are not sufficient. Healsafe Interiör has developed a unique, robust, durable, and safe sound absorber that cannot be torn down from the wall. The unique construction consists of a reinforced fire-rated fibre gypsum board with high-pressure laminate and fire-rated sound-absorbing mineral wool. The micro-perforations, measuring just 0.5 mm, are small enough to prevent dust and liquid droplets from penetrating the material. For nature-themed photographic designs, please see the product ["Wall Art"](#). The construction prevents the unit from being removed from the wall. Sold in packs of 10.
